

Carbon 12

Carbon 12 is the state which has to have Carbon to Form Life. Carbon 12 is found in most cases to be Solid – in Silica rocks. It can also be found in a soft state, and the different forms can be liquid, slurry, and gaseous.

In most cases when Carbon 12 is in its' gaseous form, the plants absorb Carbon 12 from the atmosphere via the process of Photosynthesis.

It is important to know that the plants do not produce more Carbon 12 by themselves. This is because there is a restriction in the process of obtaining Carbon 12 due to the nutrition imbalances of the concentration of the CO₂ deficiencies in the atmosphere.

Carbon 12 is the main element which forms all of the structures of life. This process starts with the Amino Acids, and the group of Amino Acids form the Proteins. The Proteins form the genetic spiral, and the Chromosomes form which leads to

the Cellular Division. This leads to the peptide chain formation, thus, the metabolic, physiologic, and biochemical functions occur. And this is the pattern on which plants germinate, grow, flower, and fructify.

When the level of Carbon 12 in ionic diffusion reaches its' optimum form and is maintained all of the time, the plants are nourished so perfectly which allows them to Codify to become what they were genetically meant to do, according to their Genetic Map. That is, producing the fruits and vegetables from the beginning of their life cycle to the end of their life cycle.

Carbon 12

Ergo Corporación, S.A. de C.V. from Mexico has found the way to manufacture its products with the technology that generates high concentrations of Carbon 12 in the plants. This technology is incorporated in the liquid and solid foliar products and also in the soil products, which enhance and correct the soil conditions.

Generally, in the soil enhancer products, all of the companies in the world use calcareous or lime sources. However, these sources present restrictions in their functionality.

Ergo Corporation, S.A. de C.V. is the only company that manufactures its foliar and soil products through Nano biotechnology, which generates the absorption of Carbon 12 by the plants.

In all of our formulations, either foliar or soil, liquid or solid, the necessary elements that generates the Carbon 12 in condensed gaseous form are present, and that form of Carbon 12 is what is absorbed by the plants through the plants own process of Photosynthesis.

Many Scientists are talking about Organic Carbon which is the organic matter derived from decomposition, and animal manure. Carbon 12 is different. We are talking about Carbon that is ready, in a suitable state to form the structures with all of the other nutritional elements of the plant.

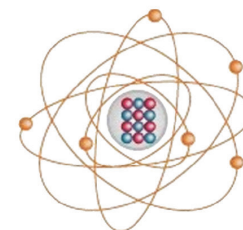

Through the element of our Technology, the plant will take advantage and promote enough absorption of Carbon 12 and also take advantage of the nutrients provided by the Grower.

We have to remind you that Carbon 12 is the main element in the Universe which forms all the structures of all the other existing elements. Carbon 12 is the promoter of the complete utilization of all Nutritional Elements.

We cannot imagine the technological advances that Ergo Corporation, S.A. de C.V. from Mexico has achieved with this new nutritional technology through Carbon 12. It is a benefit to all of Humanity, especially for the crops to increase productivity, quality, and in the end, provide the food necessities for the years to come.
